Sequence 7, Application US/08086410

Patent No. 5407822

GENERAL INFORMATION:
APPLICANT: I.DISON, Gerard
APPLICANT: I.DISON, Gerard
APPLICANT: BHIRE, David
ITILE OF INVENTION: Artificial promoter for the expression
ITILE OF INVENTION: Of proteins in yeast
NUMBER OF SEQUENCES: 37
CORRESPONDENCE ADDRESS:
ADDRESSE: FOLEY & LARDNER
STREET: King Street Station, Suite 500, 1800 Diagonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              US-08-277-660A-16

US-08-277-660A-16

Sequence 16, Application US/08277660A

Patent No. 5702908

GENERAL INFORMATION:
APPLICANT: Pickeley, Steven M.
APPLICANT: Pickeley, Steven M.
APPLICANT: Lane, David P.
ITILE OF INVENTION: Interruption of Binding of MDM2 and P53
ITILE OF INVENTION: Protein and Therapeutic Application Thereof
NUMBER OF SEQUENCES:
ADDRESSEE: Flehr, Hobbach, Test, Albritton & Herbert
STREET: Four Embarcadero Center, Suite 3400
CITY: San Francisco
STATE: California
COUNTRY: United States
INTERPORT NOTICE STATE: COMPATION STATE: PATHILL Release #1.0, Version #1.30
COMPUTER: IBM PC COMPATIDE
SOFTWARE: PATHILL Release #1.0, Version #1.30
CURRENT APPLICATION NUMBER: US/08/277,660A
FILING DATE: 20-JUL-1994
CLASSIFICATION: 514
ATTORNEY/AGENT INFORMATION:
NAME: Dresger, Walter H.
NEEFERNEY/CONCRET NUMBER: A-60244/WHD
FEFERENCE/DOCKET NUMBER: A-60244/WHD
FEFERENCE/DOCKET NUMBER: A-60244/WHD
FEFERENCE/DOCKET NUMBER: A-60244/WHD
FEFERENCE/DOCKET NUMBER: A-60244/WHD

Sequence 30, Application US/08424957

Patent No. 5770377

GENERAL INPORMATION:

APPLICANT: Lane, David P.

TITLE OF INVENTION: Interruption of Binding of MDM2 and PS3

TITLE OF INVENTION: Protein and Therapeutic Application Thereof

NUMBER OF SEQUENCES: 50

CORRESPONDENCE ADDRESS:

ADDRESSEE: Flehr, Hobbach, Test, Albritton & Herbert

STREET: Four Embarcadero Center, Suite 3400

CITY: San Francisco

STATE: California

COUNTRY: United States

ZIP: 94114187
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 16; DB 1; Length 11; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 29, Application US/08424957
Patent No. 5770377
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Lane, David P.
TITLE OF INVENTION: Interruption of Binding of MDM2 and P53
TITLE OF INVENTION: Protein and Therapeutic Application Thereof
NUMBER OF SEQUENCES: 50
CORRESPONDENCE ADDRESS: 50
CORRESPONDENCE ADDRESS: 51
STREET: Four Embarcadero Center, Suite 3400
CITY: San Francisco
STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Score 16; DB 1; Length 11; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                COUNTRY: United States
ZIP: 94111-4187
COMPUTER REABABLE PORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/424,957

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 27, Application US/08788822A
| Patent No. 6413335
| GENERAL INPORMATION:
| APPLICANT: Alexander, Jeffrey L. APPLICANT: Betree, Shawn
| APPLICANT: Betree, Shawn
| APPLICANT: Betree, Shawn
| TITLE OF INVENTION: Induction of Immune Response Against
| TITLE OF INVENTION: Induction of Immune Response Against
| TITLE OF INVENTION: Desired Determinants
| NUMBER OF SEQUENCES: 30
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: Townsend and Townsend and Crew LLP
| STREET: Two Embarcadero Center, Eighth Floor
| CITY: San Prantoisco
| STATE: California
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 69.6%; Score 16; DB 3; Length 13; Best Local Similarity 40.0%; Pred. No. 2.9e+03; Matches 2; Conservative 0; Mismatches 3; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SOFTWARE: Patentin Release #1.0, Version #1.30 CURRENT APPLICATION DATA: APPLICATION NUMBER: US/08/788,822A
Sequence 11, Application US/08912560A
Petent No. 6066484
GENERAL INFORMATION
APPLICANT: HATNAKA, Haruyo
APPLICANT: ASHIKARI, Toshihiko
APPLICANT: OGAMA, Jun
APPLICANT: SHIMZU, Sakayu
TITLE OF INVENTION: NOVEL PURINE NUCLEOSIDASE
FILE REFERENCE: 001560-309
CURRENT APPLICATION NUMBER: 1997-08-18
EARLIER PELING DATE: 1997-08-16
SARLIER PILING DATE: 1996-08-16
NUMBER OF SEQ 1D NOS: 11
SARLIER PILING DATE: 1996-08-16

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          OTHER INFORMATION: No. 6555339el Sequence US-09-170-496D-286
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 125, Application US/08934915
PATENT NO. 5932412
GENERAL INFORMATION:
APPLICANT: DILLNER, JOAKIM
APPLICANT: DILLNER, LENA
TITLE OF INVENTION: SYNTHETIC PEPTID
TITLE OF INVENTION: PAPLILCOMAVIRUS 1
TITLE OF INVENTION: 11, 16, 18, 31,
TITLE OF INVENTION: USEFUL IN IMMUNO,
TITLE OF INVENTION: USEFUL IN IMMUNO,
TITLE OF INVENTION: DAGNOSTIC PURPO,
NUMBER OF SEQUENCES: 193
CORRESPONDENCE ADDRESS:

                                                                                              The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, hepatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II atheres, cholelithiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the honeybee AKH peptide of

                                                           The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic, hypotensive, cardiant, antiatrhitic, cytostatic, nephrotropic, method of the invention may be useful for treating obssity, type II diabetes, cholelithiads, hypertension, coronary heart diesase, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for the detection of a mammalian infection by an acid-resistant microorganism (A) by treating a faecal sample with at least two different monoclonal antibodies (MAD) (or their fragments or derivatives) or aptamers (collectively (I)) and detecting formation of a complex,(C) between (I) and the corresponding antigen of (A). The first and second (I) bind to epitopes of different antigens (Ag). These epitopes are present, after passage through the intestines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting infection by acid-fast microbes for diagnosis of Helicobacter pylori, comprises reacting a fecal sample with two binding reagents for antigens that survive intestinal passage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Acid-resistant microorganism; detection; faecal; intestine; infection; monoclonal antibody; heavy chain; complementarity determining region;

                               infected or immunized with (A), or its extract, lysate, derived protein or fragment, or with a synthetic peptide. Practically all mammals display at least one of the specified epitopes. The method is used to detect infection by acid-fast bacteria, particularly of the genera Helicobacter, Wycobacterium and Campylobacter, specifically H. pylori, H. hepaticus, M. tuberculosis, C. jejuni and C. pylori. (I) may also be used therapeutically. The method is direct and non-invasive, and provides an inexpensive and easily standardizable diagnosis, despite possible degradation of antigns during passage through the intestines. This sequence represents a fragment of a H. pylori beta-urease-binding antibody heavy chain complementarity determining region CDRI which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for detecting infection by an acid-resistant microorganism (A), in a mammal, using immunochromatography. The method is used to diagnose infection by an acid-resistant microorganism (A), in a mammal, such as Helicobacter, (Campylobacter or Mycobacterium, particularly H. Pylori (most preferred), H. hepatica, C. jejuni and M. tuberculosis. The method is rapid, simple, inexpensive and non-invasive, and may indicate the stage of infection. A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting infections by acid-resistant microorganisms, particularly for diagnosing Helicobacter pylori, comprises immunochromatographic detection

R are specific for an Ag which, after passage through the intestines, at least in some mammals, retains a native (or corresponding) structure against which the mammal produces antibodies (when immunized or infected with (A), or its extracts, lysates or derived proteins (or fragments) or synthetic peptides). The products of the invention have antibodcerial activity. The method is used to diagnose infection by Helicobacterial activity. The method is used to diagnose infection by Helicobacterial. H. hepatica, C. jejuni and M. tuberculosis, and also to monitor the
test strip used in the method may include a filter to eliminate particles present in the sample and only a single receptor provides a reasonably secure diagnosis, with specificity and selectivity improved by detecting several epitopes (of catalase) or different antigens (catalase and betaurease). The method can be automated. This sequence represents a uroable. The method can be automated. This sequence represents the H. Pylori catalase or betautese and betauth H. Pylori catalase or betaurease antigen which is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Heavy chain; light chain; catalase; beta-urease; detection; CDR; antigen; infection; acid-resistant microorganism; fecal; antibody; diagnosis; antibacterial; complementarity determining region.

progress of treatment. Receptors, particularly antibodies, directed against Ag can be used therapeutically for treatment of infections. The method requires only one R to provide a reasonably secure diagnosis (although use of two R improves sensitivity), so is relatively inexpensive and more easily standardized. Also it is direct, non-invasive, suitable for automation and may indicate the stage of an infection. This sequence represents a complementarity determining region (CDR) from an antibody generated against a Helicobacter pylori antigen (catalase or beta-urease) which is used to illustrate the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method of promoting lipid mobilisation in a human which comprises administering an insect adipokinetic hormone (AKH). The hormone of the invention demonstrates anorectic, antidiabetic,

The invention relates to a method of obtaining a phage particle which has an antibody fragment directed against an antigen associated with the surface of target cells in a heterogeneous cell population. The method involves incubating a library of phage particles with the target cells to phage particles to the antibody fragment expressed on the surface of the method is useful for obtaining human antibodies against known and novel surface antigens in their native configuration, expressed on subspondantions of cells. The phage complementarity-detined subspondantions of cells. The present sequence is complementarity-determining region 3 (CDR3) of monoclonal phage antibodies (MoPhabs) used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Obtaining a phage particle, useful for obtaining human antibodies against known and novel surface antigens, by incubating a phage library with target cells to allow binding of the antibody fragment to the antigen.
hypotensive, cardiant, antiarthritic, cytostatic, nephrotropic, hepatotropic, analgesic, cerebroprotective and uropathic activities. The method of the invention may be useful for treating obesity, type II diabetes, cholelithiasis, hypertension, coronary heart disease, atherosclerosis, types I to VI glycogenosis, arthritis, cancer, renal failure, liver disease, chronic pain, sleep apnea, stroke and urinary incontinence. The current sequence is that of the painted lady AKH peptide 2 of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    complementarity-determining region 3; monoclonal phage antibody;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention discloses a method for obtaining a phage comprising an antibody, or its fragment, directed against antigens associated with a target cells surface in a heterogeneous cell population. The method comprises providing a library of antibodies, or their fragments, expressed on the surface of phage particles, incubating the phage phage phage particles associated with the target cells, separating the phage particles associated with them then the phage particles not associated with the mage cells and phage particles associated with the recovering the phage particles. Also disclosed is a cell-type specific phage antibody library and an antibody, or antibody fragment, obtained using the method. The method is useful for obtaining a selection of phage antibodies (Phabs) and monoclonal phage antibodies (MoPhabs). The method is also useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              detecting known and novel structures on various populations of blood and febtal bone marrow cells. The sequence presented is an example of the partly randomised human complementarity determining region 3 (CDR3) used in the construction of the antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Obtaining phage having antibody specific for cell surface antigen of target cells in heterogeneous cell population, by incubating phage antibody library with target cells, and separating phage particles bound
                                                                                                                                                                                                                                                                                            Phage; antibody; antigen; target cell; phage particle; cell-type specific phage antibody library; phage antibody; Phab; monoclonal phage antibody; MoPhab; blood cell; foetal bone marrow cell; complementarity determining region 3; CDR3; human.

The present invention relates to oligonucleotides (see AAL26793-AAL34659) encoding polymorphic variants of proteins related to amylases, amyloid proteins, anglobiethin, appopted a related proteins, cyclin, polymerse, oncogenes, histones, kinases, colony stimulating factors, complement related proteins, cytochromes, kinasins, cytokines, interferons, interleukins, G-protein coupled receptors and thioesterases. The present sequence is a peptide encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with a prevented, diagnosed and the proteins listed above. Disorders that may be prevented, diagnosed to the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus cand, brain, breast, colon and kidney, leukaemia), diseases of the hervous system and an infection of pathogenic organisms
                                                                                                                                                                                                                                                Immunosuppressive; immunostimulatory; antiinflammatory; cytostatic; neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor; complement related protein; cytochrome; kinase; cytokine; interferon; miterleukin, G-protein coupled receptor; thioesterase; intlammation; multifactorial disease; autoimmune disease; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Polymorphic nucleic acids encoding e.g. amylases, cyclins, polymerases, oncogenes and histones, useful for diagnosing and treating, e.g. cancer, autoimmune diseases and infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 17; DB 4; Length 14;

AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II. Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific Teall line. Amino acids 66-80 (AAR97884) and 186-200 (R99908) of the full mature 460 amino acid allergen are the most allergenic of the 90 peptides tested
                                                                                                                                                                                                                                                                                                                                                                          Japan cedar pollen allergen Cry j II epitope - comprises at least part of specified 460 aminoacid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Allergen; epitope; overlapping peptide; Cry j II; cedar pollen;

                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                    AAR97871-R97960 are overlapping peptides used for the epitope mapping of the Japan cedar pollen allergen Cry j II. Cry j II and allergenic peptides of it are useful in the diagnosis, prevention and treatment of Sugi pollinosis, the allergic reaction to Japan cedar pollen. Significant regions of the allergen were identified using the overlapping peptides of the full epitope derived from a Cry j II antigen-specific Teall line. Amino acids 66-80 (AAR97884) and 186-200 (R978908) of the full mature 460 amino acid allergen are the most allergenic of the 90 peptides tested
                                                                                                                                Japan cedar pollen allergen Cry j II epitope – comprises at least part of specified 460 aminoacid protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          æ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents residues 16-30 of the Cry j 2 protein, and is peptide of the inventitor. The peptides are derived from Japanese cedar pollen antigens, and are used as immunotherapeutic agents in the treatment of allergy. The peptides can be used for identification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Peptides derived from Japanese cedar pollen antigens are
immunotherapeutic agents – useful for allergy treatment and typing HLA
class II molecules in allergy sufferers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human thioredoxin nucleic acid and polypeptide molecules, designated 22108 and 47916. The compound that modulates the activity or expression of 22108 and 47916 nucleic acid is useful for treating or preventing a disorder characterised by aberrant activity of 22108 and 47916 expressing cell, specifically for reducing or inhibiting the aberrant activity of the 22108 and 47916 expressing cell. The 22108 and 47916 expressing cell, specifically for reducing or inhibiting the aberrant activity of the 22108 and 47916 expressing cancer cell. The 22108 and 47916 nucleic acid and polypeptide are useful for diagnosing, preventing or treating cancer in a subject (e.g. carcinoma, sarcoma, nung, breast, thyroid, head neck, prostate or genito-urinary tract), cardiovascular diseases (e.g. angina pectoris, arteriosclerosis or heart failure) or brain disorders (e.g. brain abscess, meningitis, Alzheimer's diseases). The thioredoxin DNA is also useful in gene therapy. The present sequence is human thioredoxin, 47916 peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; thioredoxin; 22108; 47916; haematopoietic disorder; leukaemia; cancer; lung; breast; thyroid; head; neck; prostate; genitourinary tract; cardiovascular disease; angina pectoris; arteriosclerosis; heart failure; brain disorder; brain abscess; mennightis; Alzheimer's disease; sarcoma; cytostatic; carcinoma; cardiant; neuroprotective; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 designated
typing of the particular HLA class II molecules in an allergy sufferer, and also for peptide immunotherapy of an allergy. Using these peptides the immunotherapy can be targeted more specifically to the requirements of the individual patient, allowing more effective treatment of an allergy, including those patients for whom treatment with a conventional immunotherapeutic agent is ineffective
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New human thioredoxin nucleic acid and polypeptide molecules, designated 22108 and 47916, useful for diagnosing, preventing or treating cancer (e.g. carcinoma), cardiovascular diseases (e.g. heart failure) or brain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

AAG62970-AAG63005 represent complementarity determining region 3 (CDR3) of VL and VH chains of antibodies of the invention. The specification describes a mixture or panel of 5 different specific binding members, each comprising an antibody VH and/or VL variable domain and capable, when displayed on the surface of filamentous bacteriophage particles or in the case of a specific binding member comprising the D5 VH and/or VL variable domain when bound to human serum amyloid protein, to pass through a mammalian blood brain barrier (BBB). The panel is useful for through a mammalian blood brain barrier (BBB). The panel is useful for the selection of specific binding members with a desired property such a billity to cross BBB, ability to bind endothelial calls or other brain cell antigen, ability to bind areas of inflammation in the brain or BBB breakdown or ability to bind intracellular adhesion molecules and to bind transferrin receptor. The antibodies are useful in diagnosis, prophylaxis and transferrin adisease, prion disease, AIDS-related dementa, epilepsy and traumatic brain injury and any diseases involving.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                androgen receptor binding peptide; androgen receptor interacting peptide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents a T-cell epitope peptide from Japanese cypress pollen antigen Chao2. The present invention describes peptides which correspond to the T-cell epitope sites on Japanese cypress pollen antigens Chao1 and Chao2. The peptides can be used as a reagent for the diagnosis of allergy to Japanese cypress pollen, and as an antigen in the reactment and prevention of spring tree pollen disease in which the pollinosis involves reactivity to Japanese cypress pollen. ```
The present invention describes a polypeptide that binds to the androgen receptor, or a polypeptide that comprises at least 50% amino acid sequence identity to the polypeptide. Also described: (1) methods of analysing the surface conformation of a protein using one or more of the polypeptide sequences mentioned above; (2) methods of identifying medularors of protein function using one or more of the polypeptide equences mentioned above; (4) a peptide that binds to the androgen receptor, the binding being competitively inhibited by the polypeptide sequences described above; (4) a peptide that binds to the androgen receptor, the binding being competitively inhibited by the polypeptide and at least a portion of a filamentous phage protein comprising the above polypeptide and at least a portion of a filamentous phage protein, the portion of the filamentous phage protein above polypeptide; (6) a filamentous phage adisplaying the above polypeptide; (7) a method of filamentous phage adisplaying the above polypeptide; (7) a method of filamentous phage adisplaying the above polypeptide; (7) a method of filamentous phage adisplaying the above polypeptide; (7) a method of filamentous phage adisplaying the above polypeptide; (7) a method of filamentous phage displaying the above polypeptide; (7) a method of filamentous of the patient, administering a disponsit on described above, and assaying the amount of the contracted androgen receptor in the body fluid or tissue of the patient, administering adisponsit on amethod of treating a patient a therapeutic amount of the comprising administering to the patient a therapeutic amount of the comprising administering from diseases characterised by abnormal levels of activation of androgen receptor, comprising from diseases characterised by abnormal levels of activation of androgen receptor, such as prostate cancer. They may also be used in biological research, as therapeutics or for in vivo classification of compounds. The present sequence represents an androgen receptor inversering
                                                                                                                                                                                                                                                                                                  New polypeptides that bind to the androgen receptor, useful for diagnosing or treating diseases associated with abnormal levels of activation of androgen receptor, e.g. prostate cancer, or in biological
androgen receptor; cytostatic; gene therapy; prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 16; DB 8; Length 5;

                                                                                                                                                                                                                                   vaccines, chemotherapeutic agents and immune response modifiers. Such proteins can be used against other diseases where an immune response is deleterious, e.g. microbial infection, tumours or autoimmune disease. Induction of tolerance suppresses production of antibodies against gp120, so prevents or inhibits 'bystander' apoptosis of uninfected T cells that are bound to gp120 protein, maximising induction of protective antiviral T cell immunity
                                                                                                                         immune deficiency virus (HIV) gp120 epitopes. Fusion 1g proteins and/or transfected cells are used to tolerise subjects to gp120 epitopes and to maintain this tolerance, particularly for treatment of HIV infection, optionally together with other therapeutic/prophylactic agents such as
                                               This sequence is an epitope used in the construction of a novel fusion immunoglobulin heavy chain (IgH) protein with a mammalian, especially human, IgH chain fused in frame at its N-terminus to one or more human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (CHIPS) from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases of disorders involving the C5areceptor (C5aR) and/or formylated peptide receptor (PPR) or neutrophils, monocytos and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, diseases of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, joint diseases, respiratory diseases, how infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                      Combination of peptides derived from chemotaxis inhibiting protein from Staphylococcus aureus (CHIPS) having CHIPS activity, useful in prophylaxis and treatment of inflammation, cardiovascular, skin and kidney diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47385) derived from the Chemotaxis Inhibitory Protein (CHIPS) from Staphylococcus aucras. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5areceptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, joint diseases, respiratory diseases and HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CHIPS; Chemotaxis Inhibitory Protein; C5a-receptor; C5aR; formylated peptide receptor; FPR; neutrophil; monocyte; endothelial cell; inflammation; cardiovascular disease; central nervous system disease; gastrointestinal disease; kin disease; protectioninary disease; joint disease; respiratory disease; livi infection; antiinflammatory; cardiant; cerebroprotective; neuroprotective; neotropic; dermatological;

Staphylococcus aureus CHIPS-related peptide #1460.

10-JUN-2003 (first entry)

```
The present invention relates to peptides (ABR44811-ABR47162 and ABR47164 ABR47365) derived from the Chemctaxis Inhibitory Protein (CHIPS) from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases or disorders involving the C5arcecptor (C5aR) and/or formylated peptide receptor (PRR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, skin diseases, genitourinary diseases, joint diseases, respiratory diseases and HIV infection
                                                       Combination of peptides derived from chemotaxis inhibiting protein from Staphylococcus aureus (CHIPS) having CHIPS activity, useful in prophylaxis and treatment of inflammation, cardiovascular, skin and
                                                                                                                                                                                                 Disclosure; Page 19; 89pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         11-JUL-2001; 2001WO-EP008004.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 11-JUL-2001; 2001WO-EP008004

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to peptides (ABR44811-ABR47162 and ABR47164-ABR47185) derived from the Chemotaxis Inhibitory Protein (CHIPS) from Staphylococcus aureus. The peptide fragments are useful in the prophylaxis or treatment of diseases of disorders involving the C5a-receptor (C5aR) and/or formylated peptide receptor (FPR) or neutrophils, monocytes and endothelial cells or involving acute or chronic inflammation reactions. The diseases or disorders include cardiovascular diseases, disease of the central nervous system, gastrointestinal diseases, skin diseases, genitourinary diseases, joint diseases, respiratory diseases, joint diseases,
